

Adding to `<head>` with React Helmet

React Helmet allows us to add to the `<head>` within a React app. It's often used to modify the title and description of a React app, especially by component or route (regardless of what routing dependency you might use).

```
<Helmet>
  <title>Amagi Academy | Blog</title>
  <meta name="description" content="Unlock your future" />
</Helmet>
```

Using React Helmet is fairly straight-forward. We can add HTML tags inside, like we'd do if we were editing a normal HTML document. Any nested components with `<Helmet>` will override duplicate head changes. Which means if you've set a title in both your index component (usually `App.js`) and a page component, the title in your page component would override that in `App.js`. Regardless of how we route our pages, we can add a `<Helmet>` tag to each page component.

<Helmet>
